

**2011 WATERMAIN PROTECTION PROGRAM
FOR CAST IRON AND DUCTILE IRON PIPES
SEPTEMBER 2011**

In an effort to preserve the integrity of the City's older cast iron and ductile iron water distribution mains, the Public Works Department will be continuing its watermain protection program. This work will take place in numerous locations throughout the City over the next three months affecting the Concord, Maple and Woodbridge areas.

This work involves using a vacuum truck to excavate a small hole in the boulevard area or on the road to provide access to the watermain. Once accessible, a sacrificial anode, which is encased in a cardboard tube, is welded to the iron watermain. The anodes are designed to corrode instead of the watermain, thereby extending the useful life and structural integrity of the pipe.

If you have any questions about this program,
please contact the Public Works Department at 905-832-8562
